

The **Stratio** project with Transporte Machado & Brites

The adoption of new technologies is fundamental for the survival of companies in the cargo transport sector. TMB's growing technological bet has been to install monitoring equipment in its fleet. Besides the software applications installed originally by manufacturers, the company has invested in Stratio because it is a platform prepared for multi-brand fleets.

Nuno Brites

TMB's Administrative and Financial Director

shared with us his opinions about working with Stratio.

According to Nuno Brites:

'The Stratio Platform helps and standardises information from the entire fleet, not only in the performance of our vehicles but also of the drivers. The Ecodriving solution has proven to be relevant not only in reducing fleet costs, but also in continuous improvement and training in the type of driving of our drivers.'

He also states that:

'The Stratio modules used by us are Ecodriving for monitoring drivers' behaviour and driving styles, Operations and the features associated with GPS, as well as Maintenance for monitoring our vehicles on the road.'

The Stratio Platform provides insights into vehicle performance and the automation of the health of its components through Artificial Intelligence models for predictive maintenance.

About TMB

The strategy of Transporte Machado & Brites (TMB) is based on its vision of being a benchmark operator in the controlled-temperature road goods transport market, with the aim of increasingly focusing on the food and pharmaceutical area in the national and international markets.

'The Stratio Platform assists and standardises information from across the fleet, not only on the performance of our vehicles as well as of the drivers.'
